Koch, Rossbach et al. 2003; Koch et al. 2004). DEHP has been classified as a priority pollutant for control by the US Environmental Protection Agency (USEPA) (Koch, Drexler et al. 2003). Daily intake limits of 20 and $37 \mu\text{g kg}^{-1} \text{body weight day}^{-1}$ are the reference dose of the USEPA and the tolerable daily intake of the European Union, respectively (Latini 2005). Recent studies showed that high doses of DEHP could cause testicular and liver damage, possibly caused foetal malformation and death, and can induce liver cancer

Benincasa hispida, and plastic mulch, which is extensively used for the cultivation of vegetable crops, can cause severe contamination of vegetables (Du et al. 2009). In China, many plastic factories are located in suburbs in which vegetables are planted in the surrounding land. Does DEHP from the plastic factories pollute the atmosphere to cause severe contamination of the vegetables? How much does the DEHP concentration cause a food safety problem of vegetables? The present paper tries to provide some answers
