※請在答案卷內作答

1. (16%) Consider the closed-loop feedback system as given by

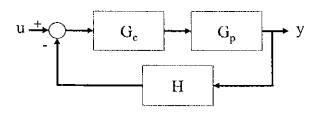

Figure 1.

where  $G_P$  and  $G_C$  denote the system plant and controller, respectively. Let the Laplace transform of the error e(t) be defined as  $E(s) = U(s) - Y(s) \cdot H(s)$ , where U(s), Y(s) and H(s) denote the Laplace transform of the input, output and feedback block, respectively.

- (a) (4%) Let  $G_P = \frac{s+2}{(s+5)(s+20)}$ ,  $G_C = 5$  and H(s) = 1. Solve the steady-state error for the two cases of input u being a unit step and unit ramp function.
- (b) (4%) Let  $G_P = \frac{s+1}{s(s+5)(s+10)}$ ,  $G_C = 5$  and H(s) = s. Solve the steady-state error for the two cases of input u being a unit step and unit ramp function.
- (c) (8%) Let  $G_P = \frac{10}{(s+1)\cdot(s+50)}$  and the input u be a unit step. Obtain the settling time (for the definition of 2% error) for the open-loop system approximately. Consider H(s) = 1 and design a controller  $G_C$  to make the settling time be less than 0.1 second.
- 2. (26%) Consider the closed-loop feedback system as given in Figure 2 below.

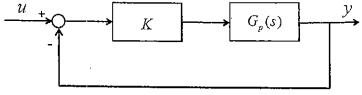

Figure 2.

Let the system plant  $G_p$  be given in the form of  $G_p = \frac{\prod_i (s + z_i)}{\prod_i (s + p_i)}$ .

(a) (12%) Obtain  $G_P$  from Figure 3 and plot the root loci for  $K \ge 0$ . Find the angles of asymptotes, the breakaway and/or break-in points on the real axis. What will be the range of K for guaranteeing the asymptotically stability of the closed-loop system?

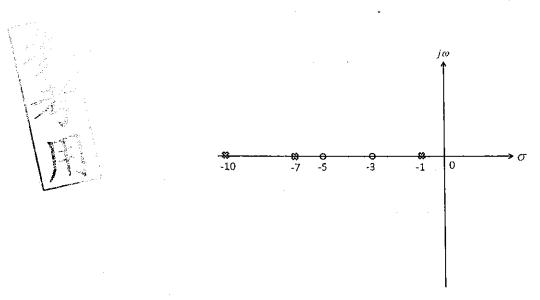

Figure 3.

(b) (14%) Obtain  $G_p$  from Figure 4 and plot the root loci for  $K \ge 0$ . Find the angles of asymptotes, the interception of asymptotes on the real axis and the breakaway and/or break-in points on the real axis. What will be the range of K for guaranteeing the asymptotically stability of the closed-loop system?

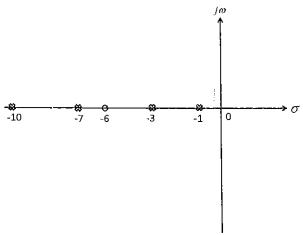

Figure 4.

- 3. (8%)
- (a) (4%) Derive the closed-loop transfer function of the system with respect to all inputs as depicted in Figure 5.
- (b) (4%) Derive the closed-loop transfer function of the system with respect to all inputs as depicted in Figure 6.

4. (34%) Consider the feedback system in Figure 7, where  $G_p(s) = \frac{1}{s(s-1)}$  and the P controller  $G_c(s) = K$ .

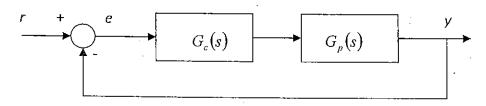

Figure 7.

- (a) (8%) Sketch the Nyquist plot of the open-loop transfer function  $G_c(s)G_p(s) = \frac{K}{s(s-1)}$  for K>0.
- (b) (4%) Determine the range of K for stability of the feedback system, where  $-\infty < K < 0$ .
- (c) (10%) To improve the stability, a PD controller is applied, that is,  $G_c(s) = K(s+z)$ , where z>0 and K>0. Sketch the Nyquist plot and find the range of K for stability. Find the asymptotes if available. Hint:  $G_c(j\omega)G_p(j\omega) = \frac{-K\omega(z+1) + jK(z-\omega^2)}{\omega(\omega^2+1)}$ .
- (d) (8%) Choose z=1 and design the control system to have the phase margin of 45°. Find the corresponding gain crossover frequency  $\omega_g$  and the phase crossover frequency  $\omega_p$ . What is the PD controller, i.e. K=?
- (e) (4%) What is the maximum allowable time delay in (d).
- 5. (16%) For a unity-feedback system with the open-loop transfer function L(s).
- (a) (8%) If  $L(s) = \frac{K}{s^2}$ , draw the Nyquist plot and magnitude-phase plot. Also determine its phase margin for K>0.
- (b) (8%) If  $L(s) = \frac{K}{s^3}$ , draw the Nyquist plot and magnitude-phase plot. Also determine its phase margin for K>0.
